BLUEBRIDGE AI

OUR AI SAID 166.
THE AUDIT SAID 47.

FOUR BUGS INFLATED OUR OWN TOOL'S SUCCESS REPORT →

START →

THE TOOL

IT FINDS FIRMS.
IT SCORES THE FIT.

We built a prospect finder: it searches directories, reads each firm's own website, and scores the match. It never touches LinkedIn.

One August sweep: 11 metros, 199 firms found, 166 ranked.

SWIPE →

THE AUDIT

EVERY REPORT SAID "QUALIFIED"

37 reports, each ending with a line like "5 qualified of 6 found." Total: 166.

We re-scored them against the tool's own rules.

47 cleared the bar.

SWIPE →

BUG 1

IT GRADED ITS OWN HOMEWORK

"Qualified" meant "not disqualified." The honest threshold count existed in the code, but it printed to a console nobody keeps.

The report and the logic used different definitions of the same word.

SWIPE →

BUG 2

A 900-PERSON FIRM RANKED #1

We build for 10-50 person firms. A 900-employee insurer with 35 locations topped a list: its branch page showed 17 people, and the tool took 17 as the headcount.

It measured the page, not the firm.

SWIPE →

BUG 3

SERVICES READ AS OFFICES

A two-office firm got disqualified for having "seven." The tool had parsed its list of services as a list of locations.

It trusted the shape of the data and never checked what it meant.

SWIPE →

BUG 4

BLOCKED PAGES SCORED ANYWAY

When a website blocked the crawler, the tool scored the firm off its search-result title.

A firm it couldn't read looked identical to a firm it had read.

SWIPE →

THE FIX

"COULD NOT DETERMINE" IS AN ANSWER

The rebuilt version reports what it couldn't read instead of guessing. The qualified count now comes from the same rule that does the scoring.

One definition, used everywhere the number appears.

SWIPE →

THE 3 QUESTIONS

ASK ANY TOOL THAT GRADES ITSELF

Does the success number come from the same code that does the work? Can a failed item look finished? What happens to the thing it couldn't read?

If nobody can answer, the number is marketing.
