

THE 5 CHECKS BEHIND SELF-RUNNING MARKETING

STEAL THE CHECKLIST FOR ANYTHING YOU'D
TRUST TO RUN ALONE →

THE SYSTEM

THIS POST GOT HERE ON ITS OWN

A system we built drafts the posts on this page, schedules them, publishes them, then reads back what actually went out.

We sell automation. Running our own operation on it is the proof.

CHECK 1

A HUMAN GATE IT CANNOT SKIP

The system only touches work a person has marked approved. Unapproved drafts don't exist to it.

Autonomy starts after the yes, never before it.

CHECK 2

"SCHEDULED" IS A CLAIM. READ IT BACK.

Three times a day, a second workflow asks the publisher what actually went out. Only then does a post get marked done.

A quiet error log is not proof the job happened.

CHECK 3

A WATCHDOG THAT EMAILS A HUMAN

Twice a day: anything due inside 26 hours and still unapproved, plus any slot that got missed, lands in an inbox.

Logs wait to be read. Deadlines need a nag.

CHECK 4

NUMBERS LAND WHERE DECISIONS HAPPEN

Impressions and comments write back into the same table the drafts live in. Every post carries its own scoreboard.

A dashboard nobody opens measures nothing.

CHECK 5

THE OLD WAY STAYS ON STANDBY

We migrated this system to a new host this month. The old copy is deactivated, not deleted, until a full week runs clean.

Rollback is a decision you make before you need it.

THE TRAP

THE SILENT 7-HOUR SHIFT

Schedulers inherit their server's timezone unless you pin one. Everything looks right, runs on time somewhere else on Earth.

The worst automation failures don't error. They succeed at the wrong thing.

FREE AI DISCOVERY CALL

WANT YOUR OPS TO RUN THIS QUIETLY?

This is the standard we build to. On the call, we map which of your workflows deserve it, and which don't need building at all.
